

ONKYO SERVICE MANUAL

STEREO GRAPHIC EQUALIZER

MODEL EQ-35

UDN, UD	120V AC, 60Hz
UW	120V or 220V AC, 50/60Hz

SAFETY-RELATED COMPONENT WARNING!!

COMPONENTS IDENTIFIED BY MARK \triangle ON THE SCHEMATIC DIAGRAM AND IN THE PARTS LIST ARE CRITICAL FOR RISK OF FIRE AND ELECTRIC SHOCK. REPLACE THESE COMPONENTS WITH ONKYO PARTS WHOSE PARTS NUMBERS APPEAR AS SHOWN IN THIS MANUAL.

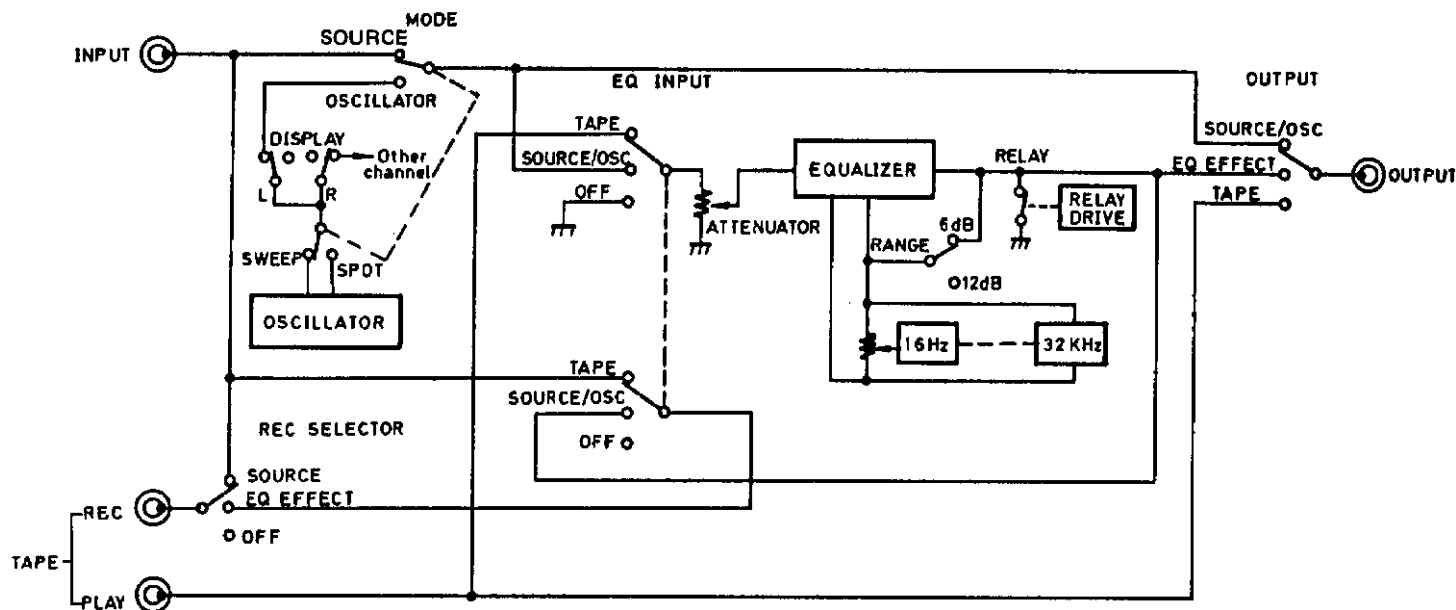

MAKE LEAKAGE-CURRENT OR RESISTANCE MEASUREMENTS TO DETERMINE THAT EXPOSED PARTS ARE ACCEPTABLY INSULATED FROM THE SUPPLY CIRCUIT BEFORE RETURNING THE APPLIANCE TO THE CUSTOMER.

SPECIFICATIONS

Input:	Input sensitivity (FLAT): 150 mV Input impedance: 50 kohms	Generator frequency response: Semiconductors:	± 0.8 dB from 32 Hz to 16 kHz 18 ICs, 88 diodes, 32 transistors
Output:	Output voltage (FLAT): 150 mV Output impedance: 3.0 kohms	AC outlet:	200 watts (UNSWITCHED) (USA and Canadian models only)
Max. input:	5 volts, 20 Hz – 20 kHz, 0.05% THD	Power supply:	AC 120V, 60 Hz (USA, Canada) AC 120/220V, 50/60 Hz (Europe, others)
Center frequencies:	16 Hz, 32 Hz, 64 Hz, 125 Hz, 250 Hz, 500 Hz, 1 kHz, 2 kHz, 4 kHz, 8 kHz, 16 kHz, 32 kHz	Dimensions (W x H x D):	435 x 89 x 365 mm
Frequency response:	± 0.5 dB from 10 Hz to 35 kHz	Weight:	4.5 kg., 9.9 lbs.
Total harmonic distortion:	Less than 0.01% at 20 Hz – 20 kHz, 1.5 V output (FLAT)	Specifications and features are subject to change without notice.	
Signal-to-noise ratio:	100 dB, 1.5V output, IHF-A input short		
Adjustable range:	± 12 dB/ ± 6 dB		
Gain:	0 dB to –20 dB		
Oscillator step frequencies:	32 Hz, 64 Hz, 125 Hz, 250 Hz, 500 Hz, 1 kHz, 4 kHz, 8 kHz, 16 kHz (spot and sweep)		

BLOCK DIAGRAM

OSCILLATOR DISTORTION ADJUSTMENT

1. Preliminary settings:

MODE: STOP (OSCILLATOR)

DISPLAY: L (or R)

OUTPUT: SOURCE/OSC

2. Adjustment

- Output 1 kHz using the SPOT pushbutton.
- While watching a distortion analyzer, adjust VR201 so that the distortion is minimized.

PRECAUTIONS

1. Replacing the lamps

This unit uses the lamps listed below.

CIRCUIT NO.	PARTS NO.	DESCRIPTION
PL1	210179	PL14V 0.08A W-3.8
PL2	210180	PL14V 0.05A W-3

2. Insulation resistance measurement

Connect the insulating-resistance tester between the plug of power supply cable and the screw on the bottom board.

Specifications; 500V, more than 10MΩ

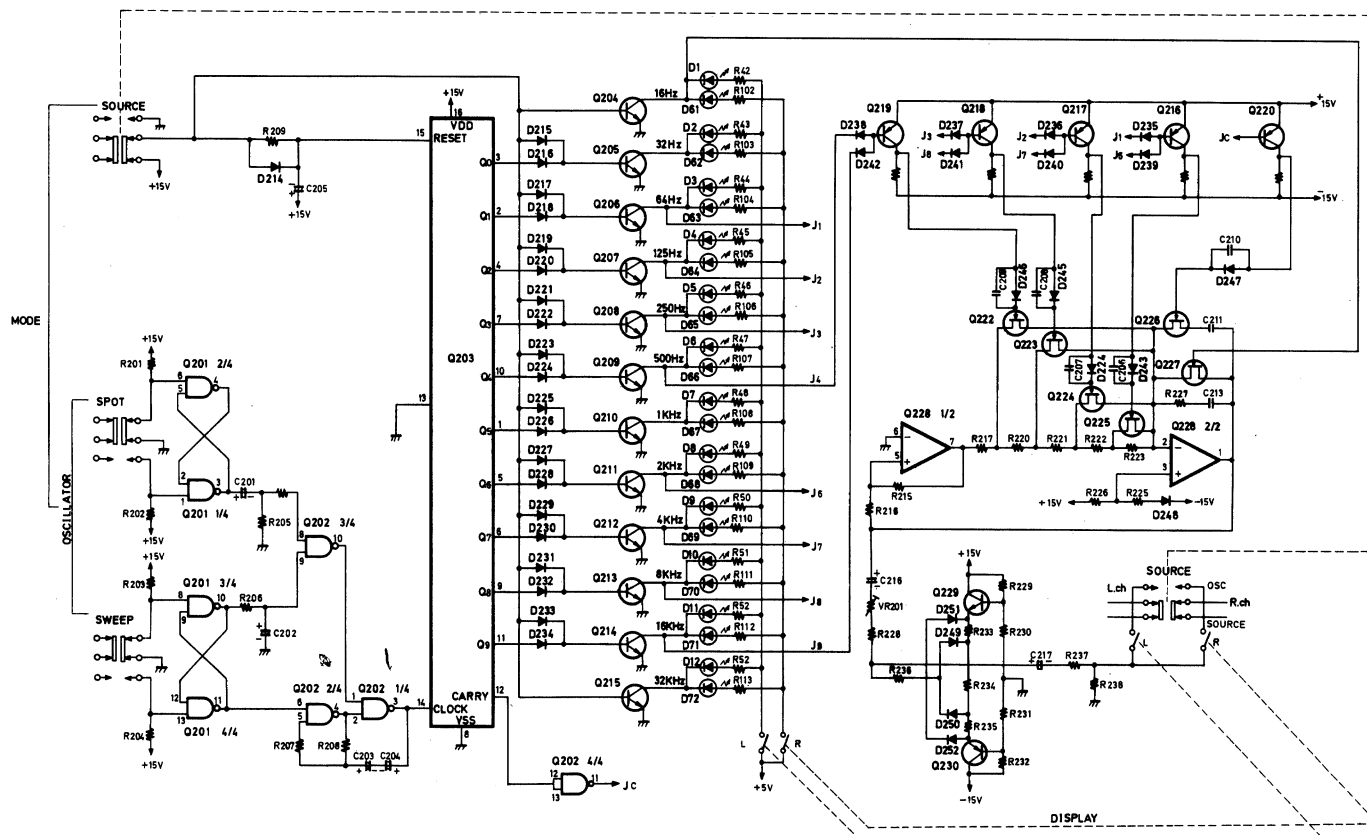

3. Voltage selector (Back panel)

Some models are equipped with a voltage selector to conform with local power supplies. Be sure to set this switch to match the voltage of the power supply in your area before turning the power switch on. Voltage is changed by sliding the groove in the switch with a screwdriver or similar instrument to the right or left position. Confirm that the switch has been moved all the way to the right or left before turning the power switch on. If there is no voltage selector switch on the unit you have purchased, it can only be used in areas where the power supply voltage is the same as that of the unit.

CIRCUIT DESCRIPTION

Oscillator circuit

1. Oscillator

When the mode selector SOURCE pushbutton is pressed, all level control LEDs (D1–12, D61–72) light. When SWEEP is pressed, the oscillator circuit (Q202 1/4, Q202 2/4) connected to the clock terminal of Q203 begins to oscillate, the Q203 terminals Q1–7 and Q9 go to H in order and LEDs D1–12 and D61–72 light in order (the 16Hz and 32kHz LEDs do not light). Oscillator sweep is then repeated between 32Hz and 16kHz.

When STOP is pressed, sweep operation stops and the LEDs light one by one. Each time the SPOT pushbutton is pressed, one pulse is applied to the clock terminal of Q203 and the lighted LED moves to the right one step at a time up to 16kHz after which the 32Hz LED lights again.

Q288–230 are the built-in oscillator in the graphic equalizer and Q228 is the oscillator circuit. The output of Q0–9 of Q203 switches FET Q222–226 to switch the value of “C, R”. This advances the oscillation frequency to match each center frequency. During this procedure, capacity is H when the Q0–4 CARRY terminals of Q203 and H and L when Q5–9 are H.

For example, when Q2 or Q203 is H, the 125Hz LEDs light and, at the same time, Q224 is turned on via J2 and the resistance of integrator becomes $R_{217} + R_{220} + R_{221}$. At this time, CARRY of Q203 is H so Q226 is turned on via JC, C211 is turned on and a triangular wave of 125Hz is generated. This triangular wave is then converted to a similar sine wave by Q229 and Q230. The semi-fixed resistor VR201 is used to adjust the distortion of the oscillator.

USING THE LEVEL CONTROLS

Equalization range

16 Hz

This frequency range is not found in records and pre-recorded tapes. It is felt more as a vibration or wave of pressure than as music. Lowering this level control is often an effective way to cut out motor noise, rumble and other unwanted low-frequency elements from a turntable.

32 Hz ~ 64 Hz

This range includes the low rumbling sort of sounds created by a pipe organ or the lowest range of a piano. Lowering this level control eliminates humming noises from electric musical instruments, ventilation systems and other sources.

125 Hz

Frequencies around 125 Hz are the standard "bass" tones most people are familiar with. The position of this level control is very important since it has a major effect on the amount of "richness" or "body" in the music.

250 Hz ~ 500 Hz

These two frequency ranges contain most sounds from musical instruments and voices. Consequently, the positions of these two level controls determine the amount of power and warmth in the music.

1000 Hz

Sounds in this range seem to strike the face, giving music a lively feeling that should be emphasized or attenuated according to the music program and listening environment.

2000 Hz

This frequency range contains the sounds that seem to pierce the ears to give trumpet notes their strength. Use this level control to adjust the power of music of this sort.

4000 Hz

Sounds in this range give music its sparkle. It is particularly important in controlling the clarity of high violin notes and other soft, high range tones.

8000 Hz

Adjusting this level control affects the barely audible high range tones that give music a feeling of detail. This is also the range where most tape noise is located so lowering this control is useful in suppressing annoying background hissing when playing back cassettes.

16000 Hz ~ 32000 Hz

Frequencies this high are mainly harmonics and overtones of other notes of musical instruments. Adjusting this level control affects the delicacy of the music and the sensation of the music "flowing" or "drifting."
